Create a Amazon Superstore Report

DataSet Name: Global Superstore

Step 1: Database Connection: Import the Global Superstore Dataset from Excel.

Step 2: Data Analysis and Transformation:

1. Explore the dataset's tables and understand their relationships.

2. Apply necessary data transformations to ensure data consistency and usability.

Step 3: Data Cleaning using Power Query Editor and DAX:

1. Utilize Power Query Editor and DAX functions to clean and refine the data.
2. Handle missing values, duplicates, and any other data quality issues.

Step 4: Visualization Models Development:

(a) Slicers, Cards, and Background Formatting:

2. Create slicers and cards to facilitate easy data filtering and summarization.
3. Enhance the report's visual appeal with background formatting.

(b) Pie, Donut, and Stacked Column Charts:

1. Generate pie and donut charts to showcase proportions and percentages.
2. Use stacked column charts to compare categories within data sets.

(c) Clustered Bar Chart, Map, and Report Formatting:

1. Construct clustered bar charts to compare multiple data points side by side.
2. Implement a map visualization to display geographic distribution or insights.
3. Format the entire report to present a cohesive and professional appearance.

Conclusions:

The Amazon Superstore Report based on the Global Superstore dataset will provide valuable insights into the business operations, sales performance, and market trends. The visualizations and analysis derived from the report will enable data-driven decision-making and aid in identifying areas for improvement and growth opportunities.
